Agricultural and food value chains (agri-chains) have a crucial role to play when it comes to alleviating poverty, ensuring zero hunger, consuming and producing responsibly, mitigating climate change, and other ambitions encapsulated by the Sustainable Development Goals (SDGs) set by the United Nations last year with a view to eradicating poverty, protecting the planet and guaranteeing prosperity for all.

In many countries, particularly the poorest, agri-chains are an important source of livelihoods and income.

The AC&SD international conference initiated by CIRAD - a French agricultural research and international cooperation organisation working for the sustainable development - and its partners is organised around three themes:

1. How are agri-chains performing with respect to the SDGs, and how can this be assessed?
2. What public policies and governance mechanisms are required to support the SDGs at different scales?
3. What innovations and partnerships could set agri-chains on the road to sustainable development?

The conference will be an exciting opportunity to hear about numerous initiatives involving a range of agri-chains’ stakeholders including business representatives, representatives of supporting institutions, investors, members of farmers’ organisations and researchers, who will be sharing their experiences and their work during the parallel sessions.
These will include:

- An analysis of the dairy chain, looking at the various ways of ensuring economic development in line with the SDGs, from West Africa to Southeast Asia via India. Are public-private partnerships a good thing? Can cooperative institutional innovations improve the lives of small-scale producers? What measures are required to support the switch from semi-subsistence to commercial systems?

- An analysis of the cocoa chain, to illustrate the emergence of public-private partnerships aimed at maintaining supplies despite the threat of climate change.

- Citizens’ initiatives aimed at establishing alternatives to the industrial concentration, notably viewed through the prism of the changes in relations between urban and rural areas: building new links between producers and consumers by creating new multi-stakeholder local circuits, establishing participatory certification, etc.

These three days of debates and discussions will help to map the different models of transition to sustainable development, and the technical and social innovations currently being experimented. They will fuel dialogue with policymakers, encourage scientists and experts to look for other development models, and launch the debate on new modes of partnership and investment.
